

BMW High-Voltage Battery Warranty Guide

Training document for the PDF and DOCX RAG hands-on exercise

Version 1.0 | September 2026

This fictional document is supplied only for software training. It is not an official BMW warranty or maintenance publication.

1. Warranty coverage

The high-voltage traction battery is covered for 8 years or 160,000 kilometres from the original vehicle delivery date, whichever occurs first.

Coverage applies to defects in battery materials or workmanship. Warranty eligibility requires the vehicle to be operated according to the maintenance and safety instructions in the owner documentation.

2. Capacity protection

During the stated warranty period, battery repair may be considered when measured usable capacity falls below 70 percent of the original usable capacity and the condition is confirmed by an authorised diagnostic test.

Normal capacity reduction above this threshold is treated as expected ageing in this training policy.

3. Exclusions

The training warranty excludes collision damage, flood exposure, unauthorised battery modification, use of non-approved charging equipment, deliberate misuse, and damage caused by ignoring a critical vehicle warning.

4. Battery care

For routine daily use, maintain charge between approximately 20 and 80 percent when practical. A 100 percent charge may be used before a long journey. Avoid leaving the vehicle at extremely low charge for an extended period.

Battery coolant must be inspected every 24 months. Any coolant warning, repeated rapid-charging interruption, or abnormal battery temperature message requires an authorised inspection.

5. Claim evidence

A warranty assessment requires the vehicle identification number, current odometer reading, service history, diagnostic report, and a description of the observed symptoms.

Item	Training policy
Warranty term	8 years or 160,000 km
Capacity threshold	Below 70%, confirmed by diagnostic test
Coolant inspection	Every 24 months
